

Integrating
the Healthcare
Enterprise

How to make EHDS successful? An industry perspective

János Vincze M.D.

Vendor Co-Chair, IHE-Europe

Sr Staff Technical Product Manager, GE HealthCare

The European Health Data Space (EHDS) architecture is a framework that includes:

- **Rules:** A set of rules that govern the use of electronic health data
- **Common standards and practices:** A set of standards and practices that apply to the use of electronic health data
- **Infrastructures:** A secure digital infrastructure for sharing health data
- **Governance framework:** A framework that governs the use of electronic health data

The EHDS aims to:

- Give individuals more control over their electronic health data;
- **Allow healthcare providers to access patient data** with consent **across Europe (primary use)**;
- Enable the **sharing of** anonymized or pseudonymised **health data for research, innovation,** and policy-making (**secondary use**);
- **Create a European single market for electronic health record systems, medical devices, and AI systems;**
- Ensure compliance with the EU's data protection standards.

Why is the success of EHDS important for Europe?

Strengths

- Europe is the traditional epicenter for medical innovation
- R&D hubs of global vendors are located throughout the continent
- Hundreds of startups and SMEs in medtech, especially in AI
- Evidence: a patent in medical technology is filed every 30 minutes

Weaknesses

- Focus of innovation shifted to other regions: USA and China
- Innovative products are launched in Europe with multi-year delays
- Small vendors have limited opportunity for scaling

Root cause: fragmented market, regulatory and technical environment

Work is underway to develop the **European EHR eXchange Format (EEHRxF)**.

IHE-Europe is part of the team recommending the new (**HL7 FHIR**-based) standards as the basis of the **MyHealth@EU** infrastructure.

COCIR
Advancing Healthcare

We cannot afford the cost to **stick-build** an entire new European infrastructure from scratch.

We need to address the inherent **risks** in adopting a new and **emerging** standard.

To capture the **benefits** of EEHRxF, we need to “**productize**” its adoption at **scale**.

Myth

If you are standards-based, you are interoperable.

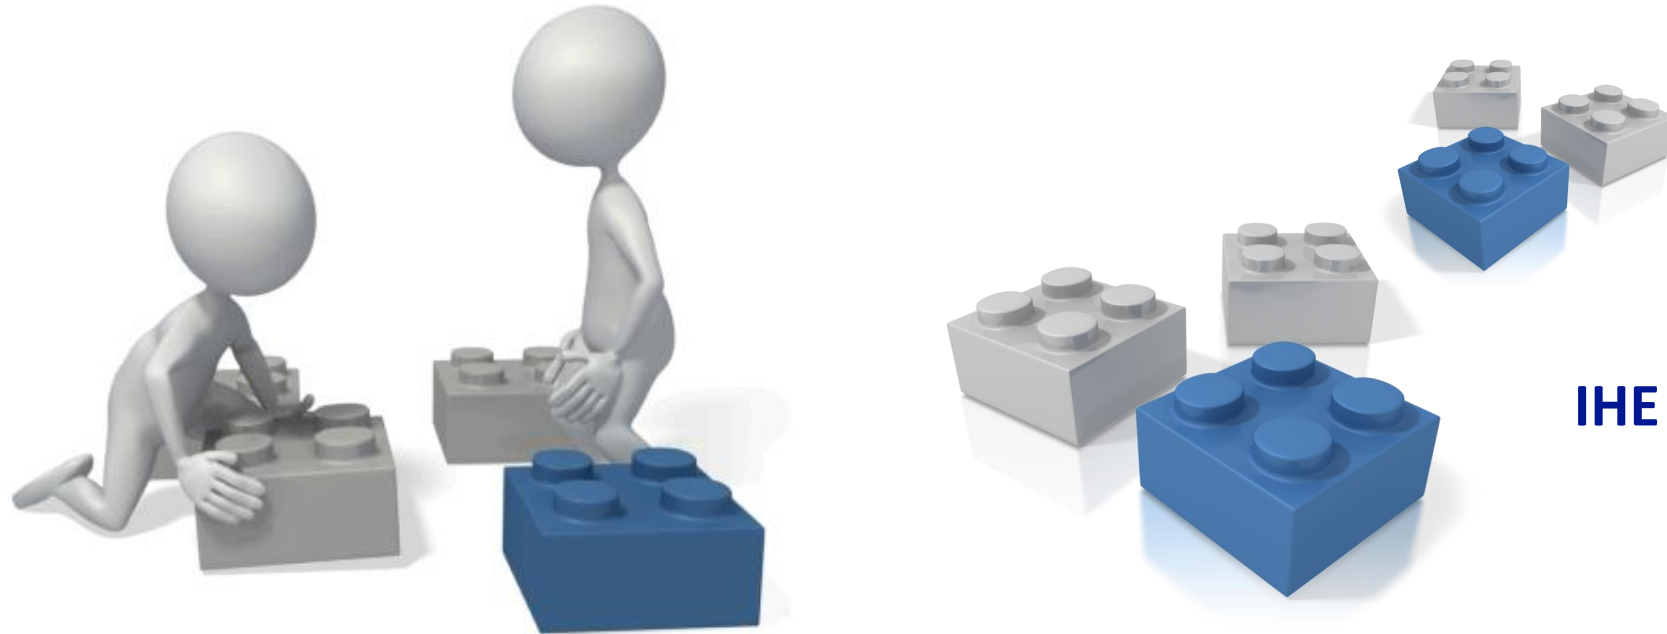

Reality

Interoperability relies on all the parties in the ecosystem using the **same** standards in the **same** ways.

The **IHE Methodology** is a proven way to develop implementable, conformance-testable digital health specifications that “click together” like **building blocks**.

Having IHE profiles enable vendors to create digital health **products** that operationalize **assemblies** of these building blocks as collections of *conformance-testable* functionalities.

IHE Profiles

Main steps of IHE methodology:

- **Step 1:** Profile creation based on applicable standards
- **Step 2:** Testing through the testing continuum
 - Plugathon
 - Connectathon
 - Projectathon
- **Step 3:** Establishment of a conformity testing platform

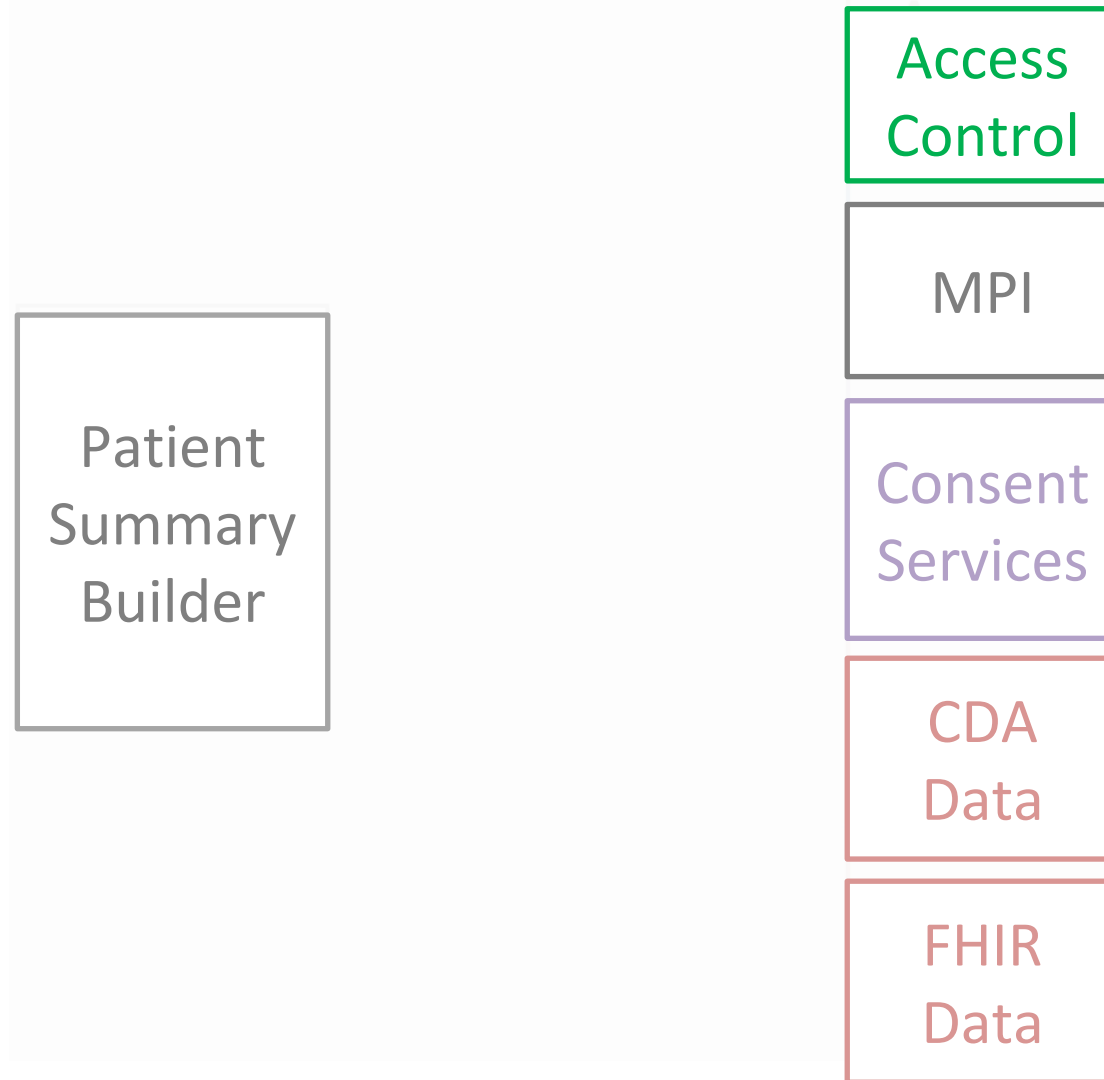

Example:

A digital health product needs to support on-demand generation of an **EEHRxF-conformant Patient Summary** document. It must be able to:

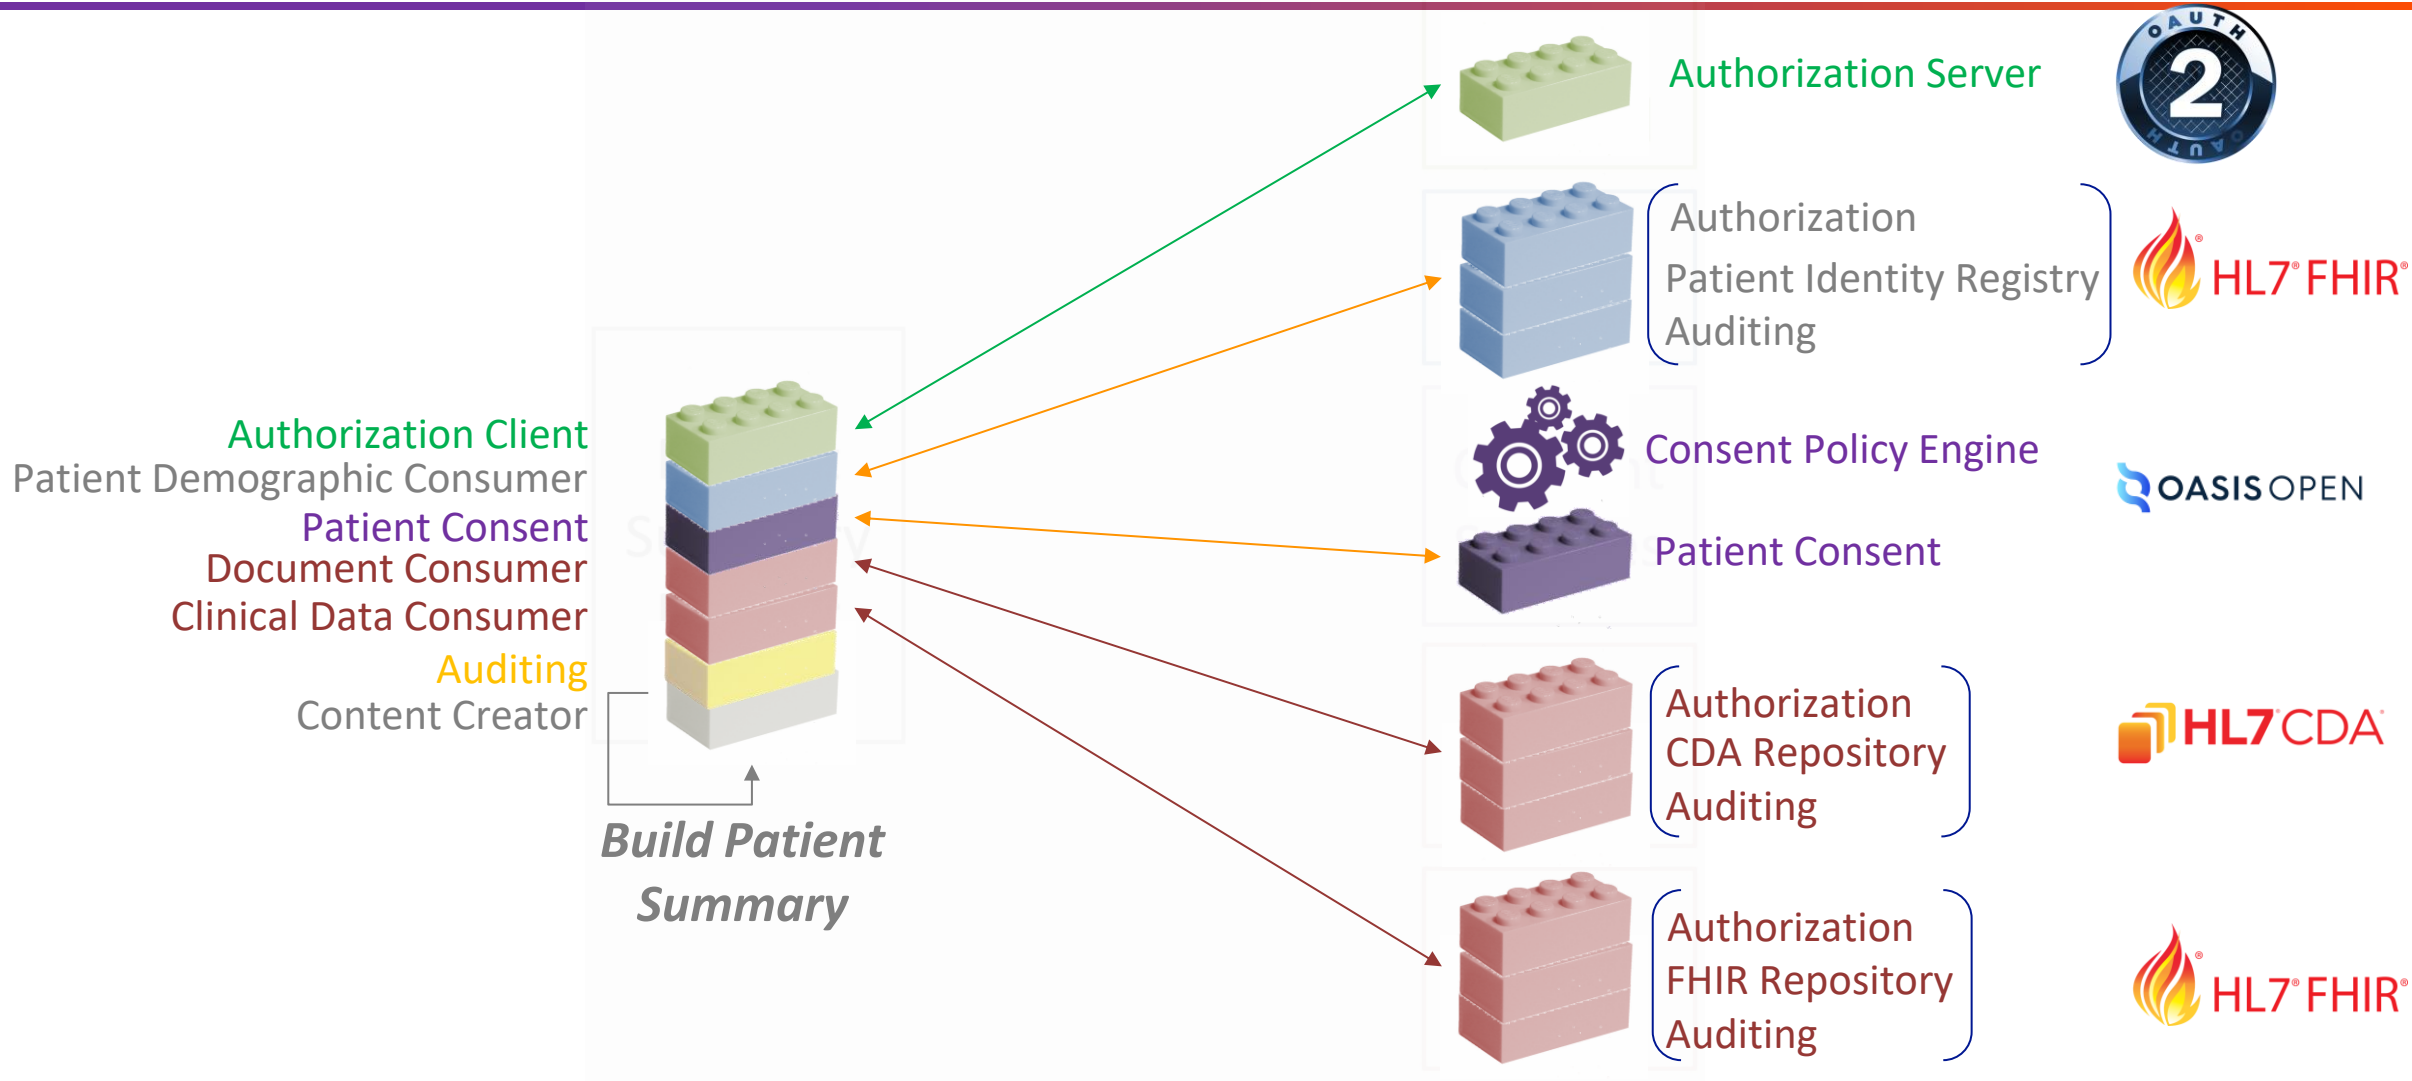

- Authorize **access** to the patient's health data
- Establish the patient's enterprise-wide **identifier**
- Obtain their data from legacy **CDA** repositories (respecting consent)
- Obtain their data from **FHIR** repositories (respecting consent)
- Build the **on-demand** summary.

Jurisdictional Shared Services

Jurisdictional Shared Services

Key stakeholders

- Industry

- Establish conformance testable standards and standardized means for testing
 - Bring new EHDS compliant products to market
 - Create pathways for integrating existing products

- European Commission

- Continue to support projects towards EHDS enablement
 - Create implementing acts that support all stakeholders in achieving “plug and play” interoperability

- Member states

- Enact appropriate national legislation
 - Leverage the existing experience of industry in interoperability testing
 - Support initiatives for EHDS adoption by users

- Citizens

- Be conscious about their health and health data
 - Demand access to the highest standard of care

If done well, EHDS is a unique opportunity for

- Global vendors to introduce their products to a single European market
- European startups and SMEs to scale up
- Health care providers to gain efficiency
- Patients to receive the highest standard of care
